Engineering Practices Lab Manual - 5Th E Delmar Pub

This Handbook is prepared after extensive simulations of circuits with some electronic and engineering software such as Multisim, Pspice, Proteus, MATLAB and Circuit Logic. The Handbook is designed basically to assist both tutors and students in the conduction of laboratory experiments. It has been proven over time that students tend to remember the experiments that they had conducted much better than the lectures that they received. The Handbook has been written in a simple technical language and the mathematics behind the experiments have been clearly derived and explained. The book is intended to add wealth of knowledge, especially in physics, electrical and electronic and communications engineering programmes for students in tertiary institutions such as Polytechnics, Monotechnics and Universities. This Handbook contains five sections and a total of thirty-three experiments which can be categorized into Basic Electronics Software, Communication System Engineering experiments and Optical Communication experiments. Each experiment contains objectives, materials, theoretical background and procedures. The procedure involves steps and questions for understanding the experiments being conducted.

The Laboratory Manual is a valuable tool designed to enhance your lab experience. Lab activities, objectives, materials lists, step-by-step procedures, illustrations, and review questions are commonly found in a Lab Manual.

Electrical Wiring Residential Cengage Learning

This laboratory manual is intended for use in an Introduction to Electrical and Computer Engineering course and is appropriate for two- and four-year electrical engineering curriculums. The manual contains sufficient exercises for a typical 15-week course using a two-to-three-hour practicum period. The topics range from basic laboratory procedures series-parallel circuits, mesh and nodal analysis, an introduction to capacitors and inductors as well as basic digital logic, Boolean equivalents, digital encoders, decoders, mux and demux circuits as well as basic circuits for digital computation. For equipment, each lab station should include a dual adjustable DC power supply and a quality DMM capable of reading DC voltage, current and resistance. A selection of standard value 1/4 watt carbon film resistor ranging from a few ohms to a few mega ohms is required along with 10 k Ω and 100 k Ω potentiometers, 100 nF and 220 nF capacitors, and a few discrete 7400 series logic gates and 555 timers. Each exercise begins with an Objective and a Theory Overview. The Equipment List follows with space provided for serial numbers and measured values of components. Schematics are presented next along with the step-by-step procedure. All data tables are grouped together, typically with columns for the theoretical and experimental results, along with a column for the percent deviations between them. Finally, a group of appropriate questions are presented. For those with longer scheduled lab times, a useful addition is to simulate the circuit(s) with a SPICE-based tool such as LTSpice, or similar software, and compare those results to the theoretical and experimental results as well.
