Industries and Careers for Undergraduates IGI Global

This book is for engineers of different disciplines, such as chemical, electrical, petroleum, mechanical and civil engineering, and will appeal both to the experienced professional engineer and to undergraduate or postgraduate engineering students. This singular volume presents selected articles on themes that arise at the interface between engineering and the different societies in which it is practised. Themes of current interest include ethics, gender balance, education, workplace preparation, communication, competencies, and the future of engineering. Original and thought-provoking articles on these themes are presented by authors who have achieved international recognition for their work in engineering research, practice and education, and who work in different capacities in industry or higher education around the world. Recognizing the pluralism that is characteristic of such themes, each chapter presents two articles reflecting distinct perspectives and contexts. This volume therefore provides ideal opportunities for readers who wish to develop their critical thinking capacities by contrasting and evaluating the different viewpoints. It also provides readers with writing that complements the technical discourse predominant in engineering

workplaces and institutes. This book, therefore, while promoting professional literacy and thinking skills development, concurrently serves to cultivate the well-rounded and forward-looking engineers required by the international community to meet the multifaceted challenges of 21st century engineering.

Industries and Careers for Engineers

Throughout the world there is evidence of mounting interest in marine resources and new maritime industries to create jobs, economic growth and to help in the provision of energy and food security. Expanding populations, insecurity of traditional sources of supply and the effects of climate change add urgency to a perceived need to address and overcome the serious challenges of working in the maritime environment. Four promising areas of activity for 'Blue Growth' have been identified at European Union policy level including Aquaculture; Renewable Energy (offshore wind, wave and tide); Seabed Mining; and Blue Biotechnology. Work has started to raise the technological and investment readiness levels (TRLs and IRLs) of these prospective industries drawing on the experience of established maritime industries such as Offshore Oil and Gas; Shipping; Fisheries and Tourism. An accord has to be struck between policy makers and regulators on the one hand, anxious to direct research and business incentives in effective and

efficient directions, and developers, investors and businesses on the other, anxious to reduce the risks of such potentially profitable but innovative investments. The EU H2020 MARIBE (Marine Investment for the Blue Economy) funded project was designed to identify the key technical and non-technical challenges facing maritime industries and to place them into the social and economic context of the coastal and ocean economy. MARIBE went on to examine with companies, real projects for the combination of marine industry sectors into multi-use platforms (MUPs). The purpose of this book is to publish the detailed analysis of each prospective and established maritime business sector. Sector experts working to a common template explain what these industries are, how they work, their prospects to create wealth and employment, and where they currently stand in terms of innovation, trends and their lifecycle. The book goes on to describe progress with the changing regulatory and planning regimes in the European Sea Basins including the Caribbean where there are significant European interests. The book includes:

- Experienced chapter authors from a truly

multidisciplinary team of sector specialisms • (29-0000) to Farming, Fishing, and Forestry
First extensive study to compare and contrast traditional Blue Economy with Blue Growth • Complementary to EU and National policies for multi-use of maritime space

Managing Resource Abundance and Wealth: The Norwegian Experience describes the sundry and significant challenges, both economic and political, facing petroleum-producing countries. The volume outlines the pitfalls that policymakers encounter in the aftermath of a major resource discovery, and what they can do to protect their countries from the most adverse consequences. These lessons are derived

from two very different sources: The broader-if still underdeveloped-social science literature that examines the 'Paradox of Plenty' in its disparate forms; and the experience of a country that has successfully managed its natural resources over several decades. As a small country on the margins of Europe, Norway has stood up to powerful international interests in one of the world's most powerful industries. Norway has exerted sovereign control over its natural environment, and exploited its resources in a way that has delivered significant wealth to its citizens. This volume explains how Norway has largely avoided the 'Paradox of Plenty'. It aims to demonstrate the variety of policy tools that are available to states rich in natural resources, and how these tools can be adjusted to changing (domestic and international) contexts. It considers a number of questions, such as how countries need to administer and regulate the industry to consider the costs and benefits associated with various contract and licensing regimes, and fiscal arrangements; to maintain competitiveness and avoid becoming too dependent upon the sector; to maximize local content; and to protect the broader economy from the volatility of petroleum prices. The volume shows how the industry can be managed in a democratic, just, and ethical manner, and for the benefit of the general population.

A declaration of resistance, and a roadmap for radical change, from the generation that will be most screwed by climate change. The Millennial generation could be first to experience the doomsday impacts of climate change. It's also the last generation able to do something about them. With time ticking down, 31-year-old journalist Geoff Dembicki journeyed to Silicon Valley, Canada's tar sands, Washington, DC, Wall Street and the Paris climate talks to find out if he should hope or despair. What he learned surprised him. Millions of people his age want to radically change our world, and they are at the forefront of resistance to the politicians and CEOs steering our planet towards disaster. In *Are We Screwed?*, Dembicki gives a firsthand account of this movement, and the shift in generational values behind it, through the stories of young people fighting for their survival. It begins with a student who abandons society to live in the rainforest and ends with a Muslim feminist fomenting a political revolution. We meet a Brooklyn artist terrifying the oil industry, a Norwegian scientist running across the melting Arctic and an indigenous filmmaker challenging the worldview of Mark Zuckerberg. *Are We Screwed?* makes a bold argument in these

troubled times: A safer and more equitable future is more achievable than we've been led to believe. This book will forever change how you view the biggest existential challenge of our era and redefine the generation now battling against the odds to solve it.
