The Big Book of Wild Cats Princeton University Press

The bobcat looks very similar to a house cat except that it is a lot bigger - about twice the size. An overgrown house cat you might call it. Have you ever wondered why this cat is called a bobcat? It is because of its short tail. In other words, bobbed. So, bobcats are actually bob-tailed cats. Bobcats belong to the lynx family, which is also part of the bigger cat family. They are found in North America and Mexico. They are known to survive different types of climates. They are also very fierce and can take down big prey twice their size. In this book you will learn many more interesting things about the bobcat.

You will learn about their hunting skills which are truly amazing. You will learn about their habits and their social life. Are bobcats friendly with their kind? Where do they live? What do they eat? What are their predators? Are they endangered? What types of animals are they related to? These questions and more will all be answered in this book. This book also contains more than 20 photographs of the bobcat in its natural habitat. Reading this book while looking at the images will help the reader understand what the bobcat is really like.

An Introduction to the Ocelot and Margay and Other Rare Wild Cats Including Caracal, Clouded Leopard, Black Footed Cat, Fishing Cat and Iberian Lynx Rowman & Littlefield

The Australian bush holds many secrets, and one of its biggest is about to be revealed. For decades there has been talk of big cats roaming the Australian bush. These large cats - predominantly black - have only afforded their witnesses fleeting glimpses, and left behind tantalising clues: scraps of fur, a paw print or three, unusually large scats, and livestock carcasses surgically dismembered and picked clean of flesh. In their wake, they leave carnage and bewilderment: What are they? How did they get here? The authors don't just ask the questions, they seek the answers, and what they have found will intrigue the sceptic and the believer alike. The book also dedicates a chapter to the profusion of sightings and speculation in neighbouring New Zealand, and sharing for the first time highlights from the unpublished manuscript of New Zealand's first big cat hunter. Flesh-and-blood or flight of fancy? Exotic pest, mutant feral or 'extinct' marsupial lion? Join the authors as they explore one of Australia's greatest wildlife mysteries. "The authors' even-handed, open-minded approach provides ample evidences for the theories they touch upon...this is a first-rate Fortean classic,

fastidiously sourced, and essential reading for all students of the ABC phenomenon." - Fortean Times "At 434 pages, it s substantial. It s also highly readable, nicely formatted and very well illustrated. The authors have collated a vast amount of information gleaned not only from published sources but also from interviews with both eyewitnesses and people who have examined evidence firsthand. So, to anyone seriously interested in mystery animals, mystery big cats or Australian mammals in general, this book is a must-have..." - Dr Darren Naish, author of Scientific American blog Tetrapod Zoology"

Did you know that European royalty once used cheetahs to hunt deer, or that caracals can capture birds by leaping six and a half feet straight up into the air from a standing start? Have you ever wondered whether domestic cats really do land on their feet when they fall, or how Canada lynx can stalk their prey in the winter without falling through the deep snow? Wild Cats of the World is a treasure trove of answers to questions like these, and many others, for anyone who's interested in learning more about the world's felids, including the ones with whom we share our homes. Mel and Fiona Sunquist have spent more than a decade gathering information about cats from every available source, many of them quite difficult to find, including scientific papers, descriptions of hunts, archeological findings, observations by naturalists and travelers, reports from government agencies, and newsletters from a wide variety of organizations. Weaving information from these sources together with their own experiences observing wild cats around the world, the Sunquists have created the most comprehensive reference on felids available. Each of their accounts of the 36 species of cat contains a description of the cat, including human interactions with it, as well as detailed data on its distribution, ecology and behavior, status in the wild, and efforts to conserve it. Numerous

photographs, including more than 40 in full color, illustrate these accounts. Ranging from the two-pound black-footed cat to the five-hundred-pound tiger, and from the African serval with its satellite-dish ears to the web-footed fishing cat of Asia, *Wild Cats of the World* will fascinate and educate felid fans of any stripe (or spot).

Africa is famous for its big game and big cats. But if it didn't also have small cats, this great continent would soon be awash in rodents and other small animals. African wildcats are widespread and were domesticated thousands of years ago to become house cats. As part of an international lineage, they are described in another book in this series. But what about that spotted cat with the super-long legs? And the one with crazy ears? In this book, meet those two remarkable members of the cat family -- serval and caracal, respectively -- along with three other uniquely African cats. Each chapter contains statistics, pictures, Red-List status and information about the cat's lifestyle and wild prey. There are also links to conservation sites online for you to learn even more, as well as an extensive reference section in the back of the book. Cats have been popular household pets for thousands of years, and their numbers only continue to rise.

Today there are three cats for every dog on the planet, and yet cats remain more mysterious, even to their most adoring owners. Unlike dogs, cats evolved as solitary hunters, and, while many have learned to live alongside humans and even feel affection for us, they still don't quite "get us" the way dogs do, and perhaps they never will. But cats have rich emotional lives that we need to respect and understand if they are to thrive in our company. In *Cat Sense*, renowned anthrozoologist John Bradshaw takes us further into

the mind of the domestic cat than ever before, using cutting-edge scientific research to dispel the myths and explain the true nature of our feline friends. Tracing the cat's evolution from lone predator to domesticated companion, Bradshaw shows that although cats and humans have been living together for at least eight thousand years, cats remain independent, predatory, and wary of contact with their own kind, qualities that often clash with our modern lifestyles. Cats still have three out of four paws firmly planted in the wild, and within only a few generations can easily revert back to the independent way of life that was the exclusive preserve of their predecessors some 10,000 years ago. Cats are astonishingly flexible, and given the right environment they can adapt to a life of domesticity with their owners—but to continue to do so, they will increasingly need our help. If we're to live in harmony with our cats, Bradshaw explains, we first need to understand their inherited quirks: understanding their body language, keeping their environments—however small—sufficiently interesting, and becoming more proactive in managing both their natural hunting instincts and their relationships with other cats. A must-read for any cat lover, *Cat Sense* offers humane, penetrating insights about the domestic cat that challenge our most basic assumptions and promise to dramatically improve our pets' lives—and ours.
